New York City TLC Project Preliminary Data Summary

Executive Summary Report

Project Overview

The NYC Taxi & Limousine Commission has contracted with Automatidata to build a regression model that predicts taxi cab fares. To kickstart this project, the Automatidata data team performed a preliminary inspection of the data supplied by the NYC Taxi and Limousine Commission in order to inform the team of key data variable descriptions, and ensure the information provided is suitable for generating clear and meaningful insights.

Details

Key Insights

- Explored dataset to find any unusual values.
- Considered which variables are most useful to build predictive models (in this case: total_amount and trip_distance, which work together to depict a taxi cab ride).
- Considered potential interactions between the two chosen variables.
- Examined which components of the provided data will provide relevant insights.
- Built the groundwork for future exploratory data analysis, visualizations, and models.

The unusual values of the trips were identified where a short distance but have high charges associated with them, as shown in the total_amount variable. Reference screenshots below:

Total_amount variable

trip_distance	fare_amount
2.60	999.99
0.00	450.00
33.92	200.01
0.00	175.00
0.00	200.00
32.72	107.00
25.50	140.00
7.30	152.00

Remark: The total amount variable indicates that there are existence of outlier which needed to further investigate.

Next Steps

1. Conduct a complete exploratory data analysis.

2. Perform any data cleaning and data analysis steps to understand unusual variables (e.g., outliers).

3. Use descriptive statistics to learn more about the data.

4. Create and run a regression model.
